

EXTERNAL VISUAL | SITE 1

The beginning stages of the process that are unsuitable for street level are housed within this heavy, monolithic site. It mimics the surrounding buildings by being an invert cast of the existing building on the site. This would be made from hempcrete and would act as a mask covering the existing facade. The internal of the building would have extra internal support put into place to support the tanks.

EXTERNAL VISUAL | SITE 2

Located within the later stages of the filtration process, clear, usable water flows down the street, through the activity islands that house garden plots and green houses created from the existing bus stops. The water from this stage can be used to service the highstreets water usage needs - one site being the site two brewery.
